the endurance time method etm is a seismic analysis procedure in which intensifying  
 dynamic excitations are used as the loading function and it provides many unique  
 benefits in the design of structures it can largely reduce the computational effort  
 needed for the response history analysis of structures this aids in the practical  
 application of response history based analysis in problems involving very large  
 models and or requiring numerous analyses to achieve optimal design goals a single  
 response history analysis through etm provides an estimate of the system response  
 at the entire range of seismic intensities of interest thus making it ideal for  
 applications such as seismic risk assessment life cycle cost analysis and value based  
 seismic design conceptual simplicity also makes etm a useful tool for preliminary  
 response history analysis of structural systems features presents full coverage of the  
 subject from basic concepts to advanced applied topics provides a coherent text on  
 endurance time excitation functions that are essential in endurance time analysis  
 seismic analysis and design using the endurance time method serves as a  
 comprehensive resource for students researchers and practicing structural engineers  
 who want to familiarize themselves with the concepts and applications of the  
 endurance time method etm as a useful tool for dynamic structural analysis
